CQ00249088	ArcGIS Desktop	Linear Ref/DynSeg General	The Overlay Route Events geoprocessing tool crashes the application when trying to set up a line-on-line overlay if the overlay table input is not an event source
CQ00251740	ArcGIS Desktop	Linear Ref/DynSeg General	Improving labeling performance for route event sources when using SQL queries.  Labeling performance is less than optimal in the most common labeling situations, for example, when the query defines few routes and few events for display. Currently, labeling is optimized for the situation when labeling a lot of routes on the screen and few events. This has to do with the order that the query is processed. Changing how the query is processed will significantly speed up the draw time for the majority of cases.
